MPM_VPX570

Development Accelerator "Multi-Path Modulation" Software Package

Key Features

- Loopback pipeline ADC-DAC
- Quadrature Generator
- Multi-Path with N independent branches
- N independent variable delays and gain
- N independent Phase and Amplitude modulators
- Combiner for N branches
- MATLAB® model included

Benefits

- Accelerated development
- Flexibility covers a maximum of application cases
- Reference design with VHDL source code included
- MATLAB model allows user to start development prior to hardware supply
- AS9100 and ISO9001 certified company

MPM_VPX570

The MPM_VPX570 Multi-Path Modulator Software package from VadaTech provides additional FPGA image and source code for the VPX570, intended to accelerate the development of a customer's end application.

The standard VPX570 is delivered by default with a BSP reference design loaded that allows a customer to test all of the board hardware features and acts as a start point for custom code development. The additional Multi-Path Modulator Software is a separate package implementing a pipeline between the ADC and the DAC using a subset of the available hardware functions.

The loopback pipeline between the ADC and the DAC integrates the following features:

- Quadrature Generator: Hilbert Transform to generate the complex representation of the real-valued ADC output
- Splitter: Splits the Quadrature generator's complex output to N independent branches
- Delay: Delays the input signal by a variable delay value
- Phase and Amplitude Modulator: Modulates the complex signal by a complex exponential, and applies gain
- Combiner: Sum the N Phase and Amplitude Modulator outputs
- (Optional) Controller: AXI4-Lite control of the Delay, Phase and Amplitude modulator parameters

A Matlab® model of the loopback pipeline is provided. This model does the following:

- Bit/cycle accurate simulation of each block of the loopback pipeline
- Performance measurement and comparison with Matlab® floating point equivalent functions
- Test of loopback parameters (delay, frequency, phase, gain)
- Generation of input/output files, for Xilinx simulator

Please note that VadaTech does not provide licenses for MATLAB® or third-party tools and these will have to be purchased separately.

MPM_VPX570 license conditions restrict use to implementation on VadaTech hardware only.

Figure 1: VPX570

Quadrature Generator

The Quadrature Generator transforms the real input signal to a complex output. To do so, a Hilbert transform is used, in order to remove the negative frequency component of the real input signal.

Delay

Each branch has its own independent delay block. Delay value can be updated at each clock cycle. The coarse delay blocks use FPGA UltraRAM memory. The minimum coarse delay is 6 clocks cycles (due to URAM minimum latency), and the maximum coarse delay depends on how many URAM are implemented. This can be modified based on the number of signal branches in the system.

Phase and Amplitude Modulator

Each branch has its own modulator. The DDS Frequency/Phase as well as the gain can be updated at each clock cycle. The complete modulator pipeline operates in full precision. The input parameters DDS Frequency (phase increment) and DDS Phase (phase offset) are the inputs to a 32-bit Phase Accumulator, followed by a Phase Offset adder. The final phase is used as an address for a -SINE/COSINE lookup table. DDS Frequency and DDS Phase parameters can be changed every clock cycle to create a complex DDS output waveform.

Combiner

The combiner sums the N branch modulator outputs (48 bits), and rounds/saturates the sum output to 16-bit. The combiner output error, due to the quantization of the full scale 48-bit input to 16-bit output, stays below 0.5 LSB.

Optional AXI4-Lite Controller

For each branch, the Delay and the Phase and Amplitude Modulator have the following control signals:

- Delay Coarse
- Delay Fine
- DDS Frequency
- DDS Phase
- Gain

These control signals can be directly controlled by the user application, or routed to an AXI4-Lite Controller to control it via Microblaze, PCIe, etc.

Parameter	Minimum	Maximum	Unit
Delay coarse	6	32768 (typical)	ADC sampling clock/16
Delay fine	0	15	ADC sampling clock
DDS frequency	0	4294967295	0-360°
DDS phase	0	4294967295	0-360°
Gain	0	8191	UFix13_12

Related Products

VPX004

- Unified 1 GHz quad-core CPU for, Shelf Manager, and Fabric management
- Automatic fail-over with redundant VPX004
- 1GbE base switch with dual 100/1000/10G uplink

VPX570

- 3U ADC 12-bit @ 5.4 GSPS and DAC 12-bit @ 6 GSPS, Virtex UltraScale+
- PCle Gen3 x 16 (or x8 or x4) or No-PCle SERDES option (SRIO, XAUI, Aurora)
- Direct RF clock or on-board PLL option

VTX870

- Open VPX benchtop development platform
- Dedicated Switch/management slot
- Up to five 3U VPX payload slots

Choose VadaTech

We are technology leaders

- · First-to-market silicon
- · Constant innovation
- · Open systems expertise

We commit to our customers

- · Partnerships power innovation
- · Collaborative approach
- Mutual success

We deliver complexity

- · Complete signal chain
- · System management
- · Configurable solutions

We manufacture in-house

- · Agile production
- · Accelerated deployment
- AS9100 accredited
