UTC056

4th Gen MicroTCA Carrier Hub (MCH)
40/10GbE/PCIe/ FPGA/SRIO/CBS,
Double Module

Key Features

- Fabric options include PCIe Gen3, 40/10GbE, SRI0, Cross Bar Switch (CBS) or Xilinx VU13P FPGA for complete flexibility
- Front panel fabric expansion, e.g. quad Ports for PCIe Gen 3 (4x4, 2x8, or 1x16)
- PLL synthesizer for generating any clock frequency disciplined to GPS/IEEE1588
- Double module, full size per AMC.0 and MTCA.4
- 1GbE base switch with dual 100/1000/10G uplink
- Full Layer 3 managed Ethernet switch
- Unified 1.6 GHz quad-core CPU for MicroTCA Carrier Management Controller (MCMC), Shelf Manager, Clocking, and Fabric management
- Automatic fail-over with redundant UTC056’s

Benefits

- FPGA fabric option supports arbitrary scatter/gather or shelf-level signal processing
- Front-panel fabric expansion uses standard industry cables with copper or fiber options
- Sophisticated clocking features enabling GPS/IEEE1588/SyncE/NTP Grand Master Clock
- Virtual JTAG capability for remote programming and debugging eases FPGA code development for AMCs
- VadaTech’s Scorpionware® Shelf Management Software included at no additional cost
UTC056

The VadaTech UTC056 is a double module (MTCA.4 format) MCH with front-panel fabric expansion and RTM support (PCIe option only). Fabric options include PCIe Gen3, 10/40GbE, Xilinx UltraScale+ VU13P FPGA, Cross Bar Switch (CBS), and SRIO.

*The 40GbE Fabric option has dual 100G uplink via QSFP28 (zQSFP+) or triple SFP28 ports.*

The MCMC manages the Power Modules, Cooling Units, and up to 12 AMCs within the chassis. It also manages the fabric switch as well as the standard GbE with 10GbE uplink Base Channel switch.

The Ethernet switch is managed with an enterprise grade Layer 3 switching/routing stack and they support Synchronous Ethernet. The firmware in the UTC056 is HPM.2 compliant which allows for easy upgrades.

The unit provides Master JTAG services to the AMCs via the JSM, with an option for virtual JTAG capability.

The MCH has advanced clocking features including grand master clock and high-quality clock distribution/synthesis.

Architecture

IPMI Carrier Manager, Shelf Manager and Protocol Analyzer
The UTC056 utilizes the same proven standards-compliant IPMI management stack that has been utilized successfully in our previous generation MCH products. It supports carrier manager, shelf manager, and protocol analyzer operations to help facilitate a seamless chassis integration experience. The IPMI stack enables a rich feature set including:

- IPMI v2.0 with IPMI v1.5 compatibility
- SDR, FRU, and SEL storage interfaces (SEL stored in MRAM for high-speed/non-volatile/no-wear-out access)
- Intelligent temperature, voltage, and current sensing
- Shelf cooling policy
- Shelf activation and power management/Automatic fail-over/redundancy management
- Alarm controls
- Event notification and flexible alerting policies
- Backplane E-Keying
- CLI, SNMP, RMCP+, HTTP, and HPI
- IPMB Protocol Analyzer GUI for use on PC
- ScorpionWare GUI system manager integration tool on PC available separately

Base Channel Ethernet Switch
The UTC056 provides includes as standard a GbE base channel switch which includes two 10GbE uplink 100/1000/10G RJ-45 Ports. This switch is fully Layer 2 or Layer 3 managed enabling a comprehensive enterprise-grade routing and switching feature set. It supports Synchronous Ethernet (SyncE) and IEEE1588.

Only when the 40GbE Fabric option is chosen: This base channel switch functionality is unified into the 40GbE Fabric and as a consequence the base channels can run at 10GBase-KR in addition to the more typical 1000Base-X.

Fat Pipe Fabrics
The UTC056 provides fat pipes fabric options as follows:

**PCle Gen3 Switch with front QSFP+ expansion/uplink ports**
- Speed setting for 2.5/5/8 Gbps per lane
- Virtual Switch/Multiple domain/Non-transparent port support to enable partitioning of the system with multiple root complexes
- Includes an extra internal port which enables the GPS precision time-stamping engine (accessible from an AMC root complex board)
- 1024 Gbps aggregate bandwidth/non-blocking/cut-through architecture

**40GbE Switch with front dual QSFP+ expansion/uplink ports**
- Full Layer 2 or 3 management enabling enterprise-grade switching and routing
- Supports Synchronous Ethernet (SyncE) and IEEE1588 master and slave to facilitate advanced system synchronization via Ethernet
- 1.2TB Gbps aggregate bandwidth options for mixed 10GbE/40GbE and full 40GbE port configurations

**10GbE Switch with front quad SFP+ expansion/uplink ports**
- Full Layer 2 management enabling enterprise-grade switching
- Supports Synchronous Ethernet (SyncE) master to facilitate advanced system synchronization via Ethernet
- 1.2TB Gbps aggregate bandwidth options for mixed 10GbE/40GbE and full 40GbE port configurations

**SRIO Gen2 x4 Switch with front QSFP+ expansion/uplink port**
- Supports 1.25/2.5/3.125/5/6.25 Gbps per lane
- 240 Gbps aggregate bandwidth/non-blocking/cut-through architecture
Cross-Bar Switch with front QSFP+ expansion/uplink port
- Supports unicasting or multi-casting of any input SERDES lane to one or more output SERDES lane
- 771 Gbps aggregate bandwidth/asynchronous/non-blocking architecture passes through any data rate up to 10.709 Gbps
- SERDES protocol agnostic (no packet framing/handling within the switch, only the AMCs need to understand the protocol)

Xilinx FPGA Ultrascale+ VU13P
- Support for any protocol defined by user
- x4 lanes to each of the AMC modules

Fabric Clock Option
The UTC056 has the capability to provide a 100 MHz HCSL PCIe Gen3 compliant fabric clock to each AMC. This option enables the recommended synchronous PCIe clocking approach within the chassis when used in combination with the PCIe fabric.

GPS and General-Purpose Clocks
The MTCA specification defines a set of clocks for telecom and non-telecom applications. The VadaTech UTC056 has the most sophisticated clocking distribution in the market to meet the most stringent requirements such as wireless infrastructure, high speed A/D, etc. The UTC056 supports the following GPS and general-purpose clocking features:
- MTCA.4-compliant low-jitter/low-skew backplane crossbar clock routing matrix for CLK1/CLK2/CLK3 for all AMCs
- Clock disciplining with arbitrary clock frequency output and holdover (Stratum-3 option) including 1PPS regeneration and holdover
- Flexible integration and synchronization between GPS, IEEE1588/SyncE, and NTP clocking enabling Grand Master clock functionality
- ‘Any Frequency’ high-quality clock generation/jitter cleaning for up to two user clocks
- Supports hitless automatic clock failover for improved reliability
- Optional built-in GPS receiver enables direct time/clock synchronization to the GPS satellite constellation

The UTC056 supports flexible front panel clock port ordering options:
- Two DC-coupled LVCMOS Inputs/Outputs, or two AC-coupled Sine-wave Inputs, or one of each
- Built-in GPS receiver for time/location/clock synchronization replacing one of the clock I/Os with GPS antenna input

GPS Receiver Enabled Features
The UTC056 can be ordered with a GPS Receiver option. The receiver disciplines an onboard high-quality DPLL which is phase/frequency aligned to the atomic clocks in the GPS satellite constellation. The onboard clock synthesis/jitter cleaning capability can be utilized to convert this frequency into any frequency desired while still remaining locked to the GPS atomic clocks.

When the GPS Receiver option is purchased the UTC056 has the capability to re-transmit the incoming GPS data via Ethernet to other nodes in the network in the Trimble TSIP binary protocol format. This GPS data is also sent out the front panel GPS RS-232 serial port in the standard NMEA format for use by external equipment. When the GPS Receiver option is purchased along with the PCIe Fat Pipes fabric, the MCH also provides a precision PCIe Timestamping Engine capability to a PrAMC PCIe Root Complex on the backplane. This engine appears as a PCIe device to the AMC card and a device driver is available which will allow the AMC card to read all GPS status including position, velocity, status, etc., in addition to precision timestamps, time trigger, and time event interrupt functionalities.

IEEE1588 PTP AND NTP Grand Master Clock
The UTC056 can provide Ethernet time services to the chassis networks on both the GbE and 40GbE fabric ports. It can be subordinate to an external PTP or NTP master server or when the GPS receiver option is purchased can act as a Grand Master clock utilizing the precision timing information provided via the GPS receiver and onboard disciplined oscillator.

Synchronous Ethernet
The UTC056 provides Synchronous Ethernet (SyncE) on the GbE and 40GbE fabric ports. With this feature, ports on the 1G and/or 40G Ethernet switches can be designated as master or slave ports and the Ethernet fabrics within the chassis can be synchronized from end-to-end with external equipment. This feature utilizes advanced telecom-grade network synchronization PLLs to provide exceptional SyncE performance.
**JTAG Master/JTAG via Ethernet Virtual Probe**

The UTC056 can provide JTAG Master Capability to send out configuration data streams via the chassis JTAG Switch Module (JSM) to configure arbitrary JTAG Slave devices on AMC cards. Virtual Probe services are also available to provide JTAG via Ethernet for Xilinx FPGAs. This allows for standard development tools such as Xilinx iMPACT/ChipScope to treat the MCH/JSM combination as if it was a standard JTAG probe. This approach frees the developer from having to attach JTAG probes directly to the AMC or JSM which can be difficult when systems are already fully assembled. It also allows for remote debugging across long distances when required without the need to install additional JTAG equipment on-site.

### INTEGRATION SERVICES AND APPLICATION-READY PLATFORMS

VadaTech has a full ecosystem of OpenVPX, ATCA and MTCA products including chassis platforms, shelf managers, AMC modules, Switch and Payload Boards, Rear Transition Modules (RTMs), Power Modules, and more. The company also offers integration services as well as pre-configured Application-Ready Platforms. Please contact VadaTech Sales for more information.

### Notes:

*1 Backplane M-LVDS clock routing and related PLL clocking features are provided regardless of the front panel clock option. When GPS (D=3) is selected, additional GPS-related features become available such as precision GPS time-stamping via PCIe, GPS data transmission via Ethernet, and GPS serial NMEA data “Y” cable is provided.

*2 Conduction cooled; temperature is at edge of module. Consult factory for availability.

*3 E=0 is recommended for PCIe fabric applications. These options correspond with the MCH backplane connector pin-out variations described in the MTCA standard.

*4 This option is only applicable when selecting 10Gbe, CBS or FPGA Option A = 1-3.

*5 This option is only applicable when selecting the 10/40GbE, 40GbE, or SRI0 Option A = 4-6.

*6 This option is only applicable when selecting 40GbE, A=5
